

Duplicate For Jira

'Duplicate for Jira' offers you powerful features to save time for configuring new projects or creating issues:

- Duplicate projects (shared configuration) including versions, components and issues
- Duplicate issues from one project to another project
- Update base information on issues or projects before you duplicate them
- Access the app functionality via REST API

By using the app you save time and resources for administration, reduce the likelihood of errors during configuration and are able to standardize processes by automation.

Popular use-cases for the app:

- Create template projects for various use cases and duplicate them when needed (Duplicate Project)
- Store recurring tasks/epics in a template project and add them to your project when required (Duplicate Issues)
- Integrate our REST API into existing workflows/tools and automate issue or project creation (e.g. SAP, MS Project)
